

Why Air Flow Dental Maintenance is Superior to Traditional Periodontal Treatment

We're excited to bring the latest dental hygiene technology to GlenHuntly Dental Clinic. Find out how Swiss-Made EMS AIRFLOW® and a Guided Biofilm Therapy treatment can benefit your smile!

Our recently installed EMS AIRFLOW® Prophylaxis Master means that you can now experience stain-free, clean teeth without the pain! No more mess, no more nails scraping like noise on the blackboard and no more cold water. It's time to give your teeth the best clean they've ever had!

- **More effective cleaning**
- **Improved patient control**
- **Reduces teeth sensitivity**
- **Faster Cleaning**
- **Ideal for use before Orthodontic Treatment**

AIRFLOW® is a revolutionary, non-contact form of dental maintenance and prevention. It projects a controlled stream of air, warm water and very fine sweet powder onto the tooth and in hard-to-reach areas to dislodge and remove food particles, plaque, discoloration and stains.

The high pressure water/air stream cleans your teeth much faster, efficiently and comfortably than the use of traditional pastes. Traditional methods are often messy, time consuming and can leave you with a not so clean taste in your mouth.

**At GlenHuntly Dental Clinic, we educate our patients about dentistry
We care about your general health as much as your oral health**

General Dental

Implants

Veneers

Whitening

Dentures

Crowns

Root Canal

AIRFLOW® is akin to being at a day spa but instead of beauticians working on your face, your dentist is gently exfoliating your teeth. Since the water in the AIRFLOW® Prophylaxis Master heats to 40 degrees, it's a positively warm experience!

It is estimated that 1mm of dental plaque contains more than 200 million bacteria. If left untreated, the bacteria can spread and develop biofilm. Biofilm is a colony of bacteria that can cause gum disease and compromise your body's immune defenses.

Looking after the whole family

What AIRFLOW® Therapy can do for your teeth

- **More effective cleaning** reaches deep into periodontal pockets up to a depth of 5 mm
- **Improved comfort** No more scrapping tools or polishing disc presses onto tooth; no heat or vibration
- **Reduced teeth sensitivity** Tiny micro particles of powder fill any exposed dentine tubules and reduce dental sensitivity
- **Faster Cleaning** Air Flow is over 3 times faster at removing stains and plaque than traditional methods. Less time in the chair and fewer interruptions
- **Ideal before ortho treatment** It removes nearly 100% of bacteria and endotoxins. The air, water and powder used in Air Flow contains no glycerin and make it easier for bonds and sealants to grip to the surface of the teeth

When using the AIRFLOW® Prophyllaxis Master device, firstly your Hygienist will place a coloured dye onto your teeth to reveal any plaque and biofilm present

in your mouth. This is a great motivational tool to show you the areas in your mouth that you need to spend a little more time cleaning at home.

Your Hygienist will then efficiently remove the plaque build-up with AIRFLOW®. This is a big step in preventing and treating gingivitis (gum disease) and periodontitis.
